Assembly

Care is necessary in the assembly of couplings, particularly in checking for both parallel and angular alignment and in setting the correct gap as shown in the tables. The coupling grooves must be completely packed with grease before the spring is inserted and a further liberal application of grease after its insertion is essential. After the assembly of the outer cover the maximum possible quantity of grease should be injected through the grease valves.

After the first hour's running at full speed and extra ‘topping up’ of grease should be given to couplings that cannot be serviced more often than every 12 to 15 months.

Lubrication

Wellman Couplings should be lubricated with good quality stiff water-free grease. The following are approved:

- Duckham - Admax S.3 (Previously H.S.G.) or Admax L.2 (Previously L.B. 10)
- Esso - H.M.P. or Beacon 2 or 3
- Mobil oil - Mobilux No 2 or Moblgrease Laritall No. 2
- Power - B.P. Energrease - R.B.B. 3 or L.S. 3
- Regens/ Texaco/ Castex - Marfan 3 or Marfan Multi-purpose 2
- Shell - Nerita 3 or Alvaria 3
- Castrol - Spheron - A.P. 2 or A.P. 3

Turbine and other high speed couplings are designed for oil lubrication as individually specified.

Maintenance

1. Periodically replenish grease through the grease valves.
2. Open up covers occasionally to check shaft alignment and to ensure that springs are lubricated against wear.
3. Clean out and renew grease in accordance with the above instructions as necessary, but at least every 12 to 15 months.

Wellman Spacer Couplings are used for process Pumps or for applications where movement of connected units is undesirable.

Spacers Couplings facilitates easy servicing of impellers, packing glands, seals, bearings, and other components. To accommodate large shaft gaps, “Full Spacer” is normally used. It can be quickly installed or removed in one piece as illustrated below. The “Half Spacer” is suitable for drives having limited space. It however, requires removal of the Cover and the Grid Elements before removing Space position.

Ratings and selection procedures are same as that of standard Wellman Couplings.

Resilient Couplings

To obtain full benefit from the resilient qualities of a Wellman Coupling it must be carefully matched to the particular characteristics of the power transmission system for which it is intended. The characteristics must therefore be carefully studied before the coupling can be specified. Although some systems are found on examination to present special problems, in most cases it is possible to select a Wellman Coupling of a rating precisely right for its purpose by using a simple formula which includes a working factor, the latter taking account of such contingencies as overloads shocks, stalling, accidental misalignment, etc.; thus:

\[
\text{Coupling rating} = \frac{\text{Normal torque in lbs-in} \times \text{factor}}{83,000}
\]

Coupling ratings are given in each of the tables appearing in later pages. Recommended factors for various duties are listed opposite. The list is not intended to be more than a general guide to such factors because each case must be studied on its merits and account taken of the particular working conditions. Sometimes reduced factors can safely be used (for example with certain low speed applications) with consequent cost savings. Wellman engineers are always ready to give advice on this subject.

After the coupling rating has been selected, it is always necessary to check the maximum bore and safe speed against the requirements of the drive. If the maximum bore is too small, a larger coupling must be selected. If the safe speed is too low, a different type of Wellman Coupling will be required.

The factors given above for Paper Mill and Steel Works drives are only a general guide. These drives are so varied in their characteristics and methods of specifying power transmitted as to be diverse that each must be considered individually. Full details should be sent to Wellman Waconia Limited, Drives from prime movers other than electric or turbine, e.g. steam, diesel, petrol engines, etc. call for individual consideration. Here also full details should be sent to Wellman Waconia Limited.

</table>

1. All couplings are fitted with greased valves, BS 1486, part I 1969 type B in covers.
2. All dimensions are subject to confirmation.
3. Any enquiry should be accompanied by the following service information:
   (a) h.p. and r.p.m. to be transmitted, (b) classes of driving and driven machines, (c) starting loads or overloads, (d) nominal diameters and lengths of shafts, extensions, standard rough bore. When ordering the following additional information should be supplied, the bore diameter and limit required for each half coupling, and whether parallel or taper.
